A: You might be interested to know that in After Effects CS6, the built-in LensBlur effect can now be used on non-linear video. It can be found under the Blur > Lens Blur menu and looks like this: In the production of integrated circuits, the circuit elements are arranged in specific patterns and then the circuits are connected to form complete circuits. The circuits are connected to form complete circuits by metal interconnect systems. Conventional aluminum interconnect systems typically have been formed by depositing a seed layer of aluminum over the entire circuit and then depositing thereover a thin layer of an oxide. Next, the oxide is removed using standard etching techniques. The aluminum is then removed from selected areas, exposing the seed layer for the next level of interconnect. This process is repeated until the last level is complete. More recently, circuit densities have increased and the overall size of the chips have decreased dramatically. This increases the number of metal lines running over the circuit chip. While this tends to improve system performance by allowing faster circuits, it also requires more stringent control of the electrical characteristics of the metal interconnects, particularly the RTS (resistance-temperature-skew) of the metal lines. While gold is the

traditional interconnect metal, it is generally used only in situations where a relatively loose tolerance is allowed. Thus, the advent of aluminum alloy metallurgy, particularly with copper, is important to obtain the manufacturing level of performance. In general, it is desirable to reduce the RTS variation across a wafer for a given set of manufacturing tolerances. As an example, current metalization processes use a wet etching sequence comprising of: a first wet etch of a photoresist layer to form opening over the etch barrier (tantalum nitride, typically); a following wet etch of a sputtered titanium layer over the etch barrier and down into the photoresist layer opening, to remove photoresist and oxide layers and to define the metalization metal line (titanium); a second wet etch of the titanium layer using a hydrogen fluoride gas etchant which etches the titanium layer selectively over the etch barrier and exposes the underlying etch barrier (tantalum nitride); and, a third wet etch of the etch barrier (tantalum nitride) using a potassium hydroxide etchant. The process results in an imbalanced bimetallic structure with concom

love with Spider-Man? Looking for content relating to the web-slinger? Well, we've got a treasure chest of web-slinging goodness for you: 1. Read it! Marvel Comic's web-slinging superstar is a multi-million dollar franchise, with a comic book, movies, TV show and other merchandise. This article will give you a brief history of Spider-Man, show you his some of his iconic comic book art, and give you some of the best stories to read! In one picture, you'll get the lay of the land. 2. Our picks You'll have a hard time finding a better visual introduction to the Marvel Comics hero than the image that comes before this one. 3. The life and times of Spider-Man Spider-Man f678ea9f9e
